Warehouse Receiving, Inventory Barcoding & Landed Cost Entry SOP — Chin Specialty Goods

Operating Manual for Port Deconsolidation, Physical Inspection & Cost Model Reconciliation

1. PURPOSE, SCOPE & OPERATIONAL MANDATE

This Standard Operating Procedure (SOP) governs inbound freight intake, physical damage verification, barcode labeling, and landed cost model updates for all Chin Specialty Goods inventory arriving at the Los Angeles logistics terminal.

Operational Scope: Covers ocean container deconsolidation, Port of Los Angeles (POLA) drayage arrivals, Less-than-Container Load (LCL) pallet breakdown, and dynamic spreadsheet model reconciliation for SKUs KC-101 through KC-108.

2. INBOUND FREIGHT RECEIVING & INTERCHANGE INSPECTION

- 2.1 Delivery Interchange Validation: Before signing the drayage motor carrier interchange receipt, the receiving clerk must verify that container numbers, ocean bills of lading (B/L), and supplier packing lists correspond exactly to the scheduled intake manifest.
- 2.2 Physical Carton Count & Outer Inspection: Tally total master carton counts by SKU. Verify that pallet shrink-wrap is intact and customs inspection security tape has not been breached. Check for water staining, crushed carton corners, and pallet overhang.
- 2.3 24-Hour Damage & Exception Escalation: Any crushed, torn, or shorted cartons must be documented with high-resolution digital photographs and noted directly on the delivery receipt before the driver departs. File an exception claim with the freight forwarder within 24 hours of gate entry.

3. BARCODE LABELING, PRODUCT SORTING & BIN ALLOCATION

- 3.1 SKU Label Compliance: Every individual consumer unit must display a clear, scannable UPC-A barcode matching the item's master product code. Master cartons must feature a high-contrast 4x6-inch shipping label displaying SKU, description, case quantity, and production lot number.

3.2 Los Angeles Fulfillment Center Bin Mapping:

- Zone A (High Velocity): KC-101 Precision Gooseneck Kettle (180-unit reorder floor) and KC-103 Digital Espresso Scale (250-unit floor).
- Zone B (Medium Velocity): KC-102 Conical Burr Hand Grinder (120-unit floor) and KC-105 Ceramic Pour-Over Dripper (220-unit floor).
- Zone C (Fragile / Temperature Managed): KC-104 Double-Wall Borosilicate Glasses (300-unit floor) and KC-107 Tritan Cold Brew Pitchers.

4. LANDED COST & SPREADSHEET MODEL RECONCILIATION

- 4.1 Updating keegan_sku_margin_calculator_v2_locked.xlsx: Following physical intake, the operations clerk must open the locked model and update the following inputs:
- Cell C2: Enter Ocean LCL Freight Invoice Total (calculated at $185.00/CBM base rate plus bunker fuel adjustments).

- Cell C3: Enter Customs Clearance Broker Fees ($125.00 flat entry fee + $140.00 POLA drayage + $18.50/pallet handling).
- 4.2 Formula Verification: Verify that Column F dynamically computes true landed cost (=Supplier FOB + Allocated Ocean Freight + Customs Duty). Column G verifies wholesale pricing at 2.1x landed cost multiplier.
- 4.3 Gross Margin Guardrail: If any SKU computes a retail gross margin below 65.0% in Column I, an automatic catalog alert is triggered. Retail price adjustments must be approved by Keegan Chin prior to inventory publication.

5. QUALITY ASSURANCE ATTESTATION & RECEIVING SIGN-OFF

All received lots must be released in the warehouse management system (WMS) within 4 business hours of physical unloading. Completed receiving manifests are archived on the shared server under /Logistics/Inbound_Receiving/2026/.
